

Sensibo Airbend

Comfort & Energy Saving

Sensibo AirBend allows businesses of all sizes to automate their mini split AC units and control them from a single user-friendly platform.

“With Sensibo Airbend I can monitor and manage the units without compromising guest privacy”

Gerry McMahon

Managing Director of Prestige Bookings

As the Managing Director of Prestige Bookings Gerry McMahon had been searching for cost saving solutions for a very common problem, guests abusing air conditioning. “How many times I have seen guests put the unit on 16 degrees with the high fan while the window is open, you wouldn't believe how much I was paying in electric bills”. And Gerry understands the mentality behind this behavior, “They are on vacation, so they don’t worry about paying bills and making sure to turn off the AC when they leave for the beach.

“I was looking for a solution so I purchased some smart plugs from China for $25, it helped but it didn't solve the waste issue”. So, Gerry took to the internet and stumbled upon Sensibo’s Enterprise smart AC platform - Sensibo Airbend. **“When I discovered Sensibo, I was surprised to find a solution for this exact problem”.**

Sensibo Airbend is our enterprise smart air conditioning solution for hotels, schools, offices, hospitals and other large facilities. With Airbend, a large number of AC units can be

managed and maintained from one easy to use platform.

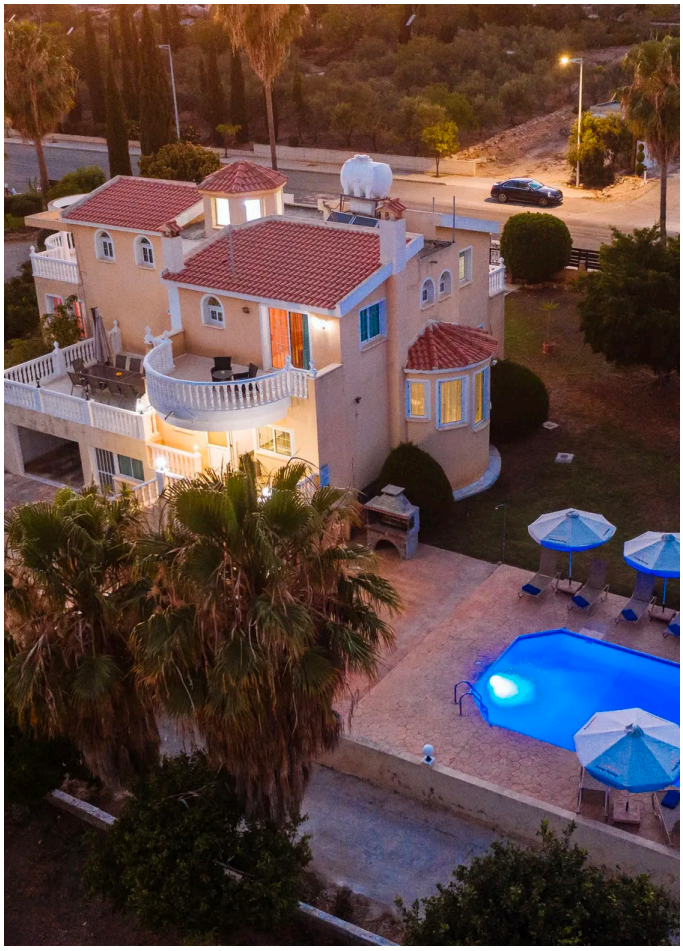

Using our smart schedules, climate react temperature thresholds and room sensors, Gerry was able to ensure that his guests wasted less AC without sacrificing their comfort. “Guests get crazy at the idea of someone coming into their room to turn off the AC when they aren't there, with Sensibo Airbend I can monitor and manage the units without compromising guest privacy”. “I set a climate react threshold to have the AC automatically turn off if the temperature reaches below 20 degrees”.

And while this may sound harsh Gerry is in the right. Most AC’s have a minimum temperature that the room can reach and running an AC at 16 degrees will not make it any cooler than say 23 degrees. An extremely low unit temperature only ensures that the compressor is on longer, wasting more energy without cooling the room any further. Beyond giving property managers remote control of all their AC units the Sensibo Airbend System only requires an active internet connection and wall outlet, no tools required. **“The Sensibo system was so easy to install, took me 5 minutes per unit and entirely pays for itself”.**
We asked Gerry how his customers have taken to the Sensibo Airbend system, “I have had zero complaints, when my guests check in I tell them that I have a smart AI powered AC system that reduces carbon emissions, while saving energy, **most guests are happy to help the environment**”.

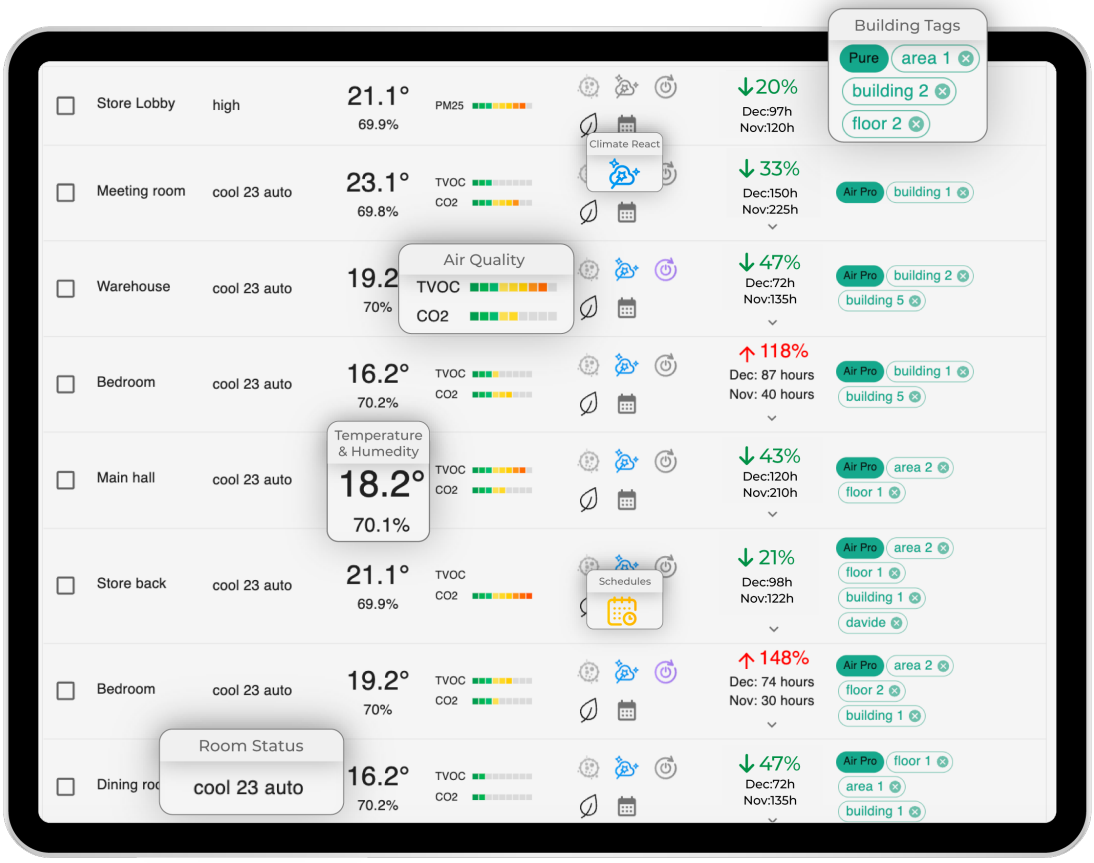

Overall Gerry had this to say about the Sensibo Airbend smart AC system “I don’t know how every hotel has not implemented this system, the savings and easy integration alone make it a worthy investment".

“The savings and easy integration alone make it a worthy investment”

Sensibo Airbend

Manage your businesses air conditioning and air quality devices in bulk. Reduce heating and cooling costs, while ensuring healthy air quality for your employees, guests, and students. Our platform is packed with smart features to help you maximize energy savings and comfort

I absolutely recommend Sensibo, for me it's a no-brainer. The product is super easy to use, very simple and cost effective. It just makes our lives much easier”
